

The features showcased during the demo were parts of the comment section, the validation checks for the comment section, and the search bar. During the demo, the comment section properly checked that each box was filled in before allowing the submission of the comment. The general layout of the website was set up. This includes the display for the weather, part of the diagram showcasing what to wear, the comment display, and the section to write a comment. The search bar correctly autocompletes for major cities in the US.

An issue faced during development was getting the search bar to autocomplete cities. This was resolved, but created a new issue in the process. When cities are displayed by the search bar instead of them appearing as a dropdown menu, they get appended to the page which causes everything below the search bar on the page to get pushed down. Another issue faced was that so much of the project depends on the weather API, work on many parts of the page stalled.
